

Operation	Description	Example
Reshaping	Changing the shape of an array	<code>reshaped_arr = arr.reshape(3, 3)</code>
Transposition	Transposing a multi-dimensional array	<code>transposed_arr = arr.T</code>
Matrix Multiplication	Performing matrix multiplication	<code>result = np.dot(matrix1, matrix2)</code>

Conclusion

Numpy is a fundamental library for data science and numerical computations. This guide covers the basics of Numpy, and there's much more to explore. Visit [numpy.org](#) for more information and examples.
